The first aquaculture pond in the MOA fishing zone generated its first aquaculture production. Initially, about 500 kilos of two well-known species were stocked: tench and claria, fresh products destined for the fish market for subsequent sale to the population. Later, as the reproductive cycles of these and other species close, they will be stockpiled for subsequent transfer and marketing to the people, who need this healthy supply so much, in order to advance step by step towards achieving food sovereignty in the territory.
